ShoePapi

A Responsive Shoe-Shopping Website

Project Overview

ShoePAPI is a responsive, multi-page shoe storefront. Visitors can browse shoes, search the product catalog, view individual products, add items to a browser-saved cart, and use the contact form and FAQ.

Project Structure

- index.html: homepage, product search, and featured carousel.
- shop.html: product catalog, category filters, sorting, and add-to-cart controls.
- product.html: product details, size and quantity selection, related products, and add-to-cart controls.
- cart.html: saved cart items, quantity controls, and order summary.
- contact.html: validated contact form and interactive FAQ.
- js/: client-side JavaScript; Components/: product photographs and logo. The homepage carousel script is inline at the bottom of index.html.

JavaScript Features

- Contact form validation: validates name, email, topic, and message; displays errors or a client-side success message.
- Product carousel: eight products, automatic group rotation, Previous/Next controls, keyboard navigation, and active-group indicator dots. Shows four products on desktop, two on tablet, and one on phones.

- Live search and autocomplete: suggests catalog matches while typing and opens the selected product.
- Skeleton loading: briefly shows animated placeholders before search suggestions appear.
- Shopping cart: adds/removes products, changes quantities, updates the cart count, calculates subtotal/shipping/total, and saves cart contents in browser storage.
- Product filtering and sorting: filters by category and sorts products by price or featured/newest order.
- Product detail interactions: displays the selected item and related products; enables size and quantity selection before adding to the cart.
- Interactive FAQ: JavaScript expands/collapses answers, updates the plus/minus icon, and keeps at most one answer open.

Limitations

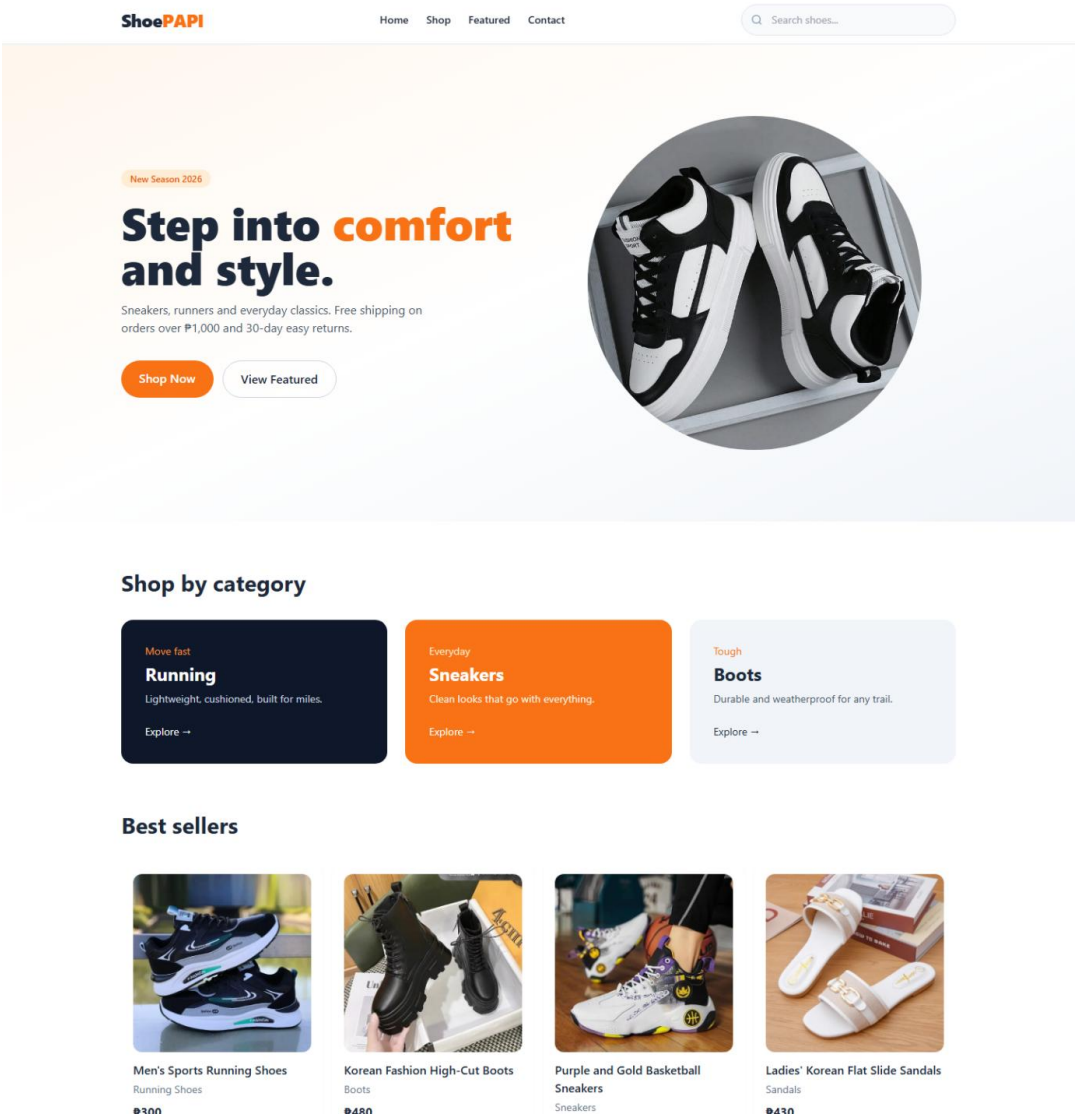

- Contact messages are not sent to a server; the form only validates input and displays a success message.
- Checkout is a demonstration and is not connected to payment processing.
- The project has no back-end server or database; cart and product interactions run in the browser.

Website Screenshots

The following screenshots were captured from the current project pages in a desktop browser.

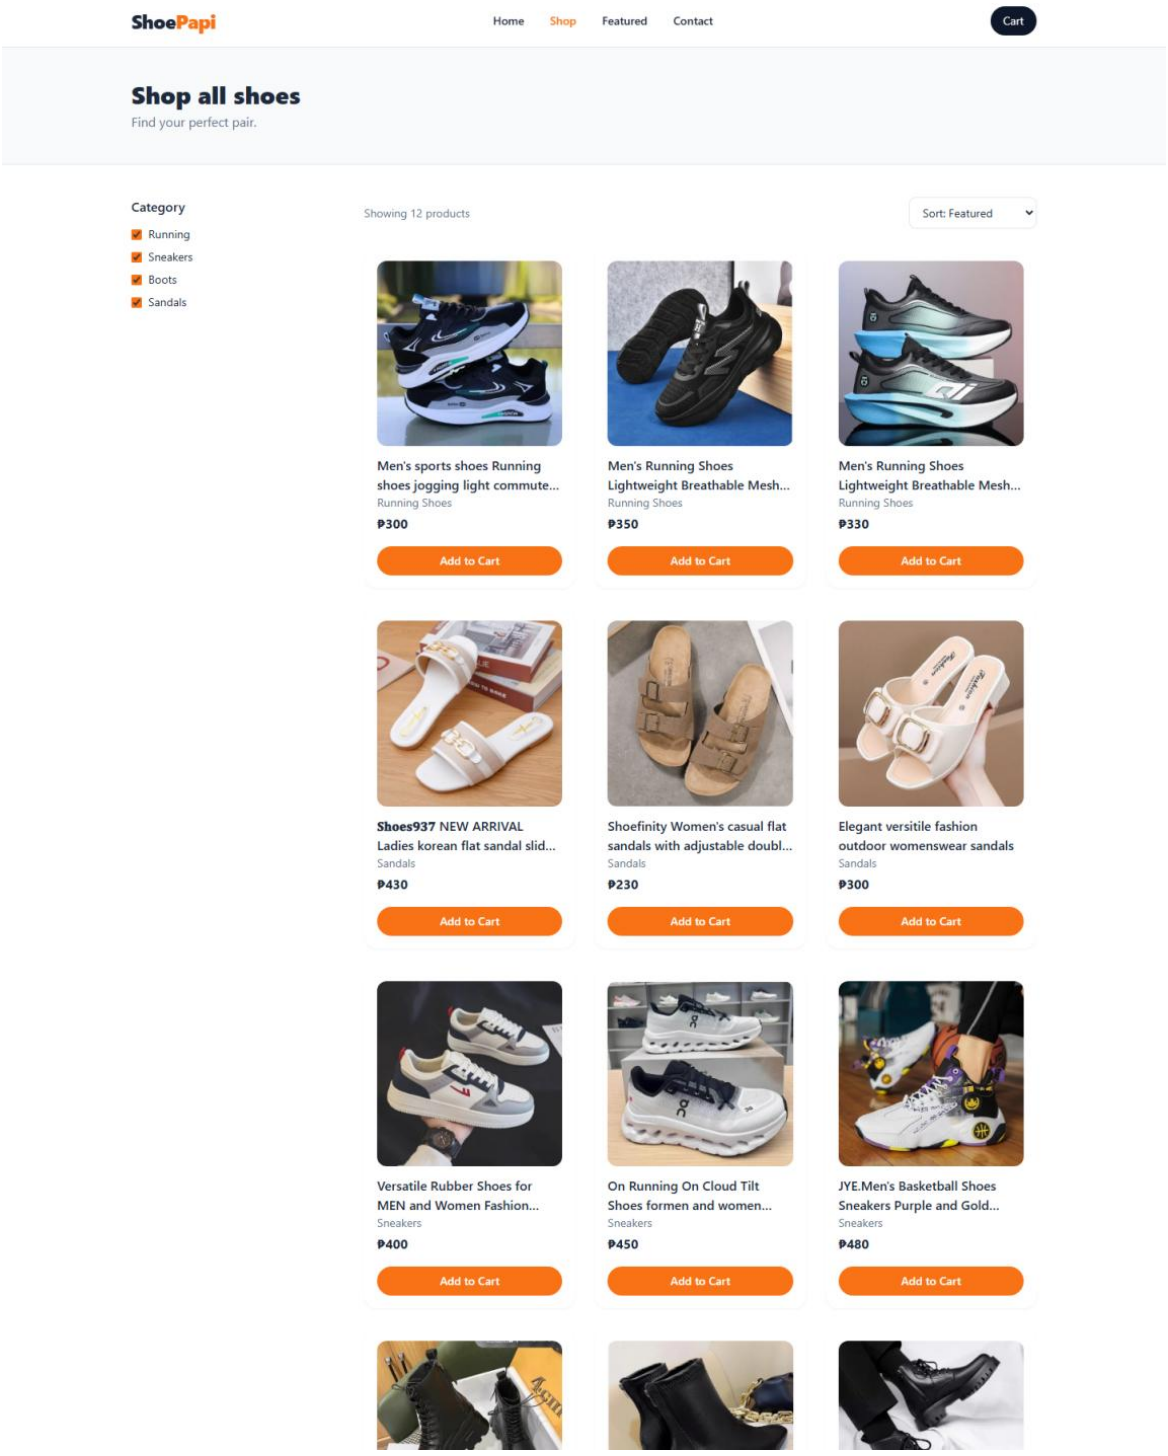

Homepage and Product Carousel

Homepage with category navigation and featured shoes. The carousel displays product groups with navigation controls and active-group indicators.

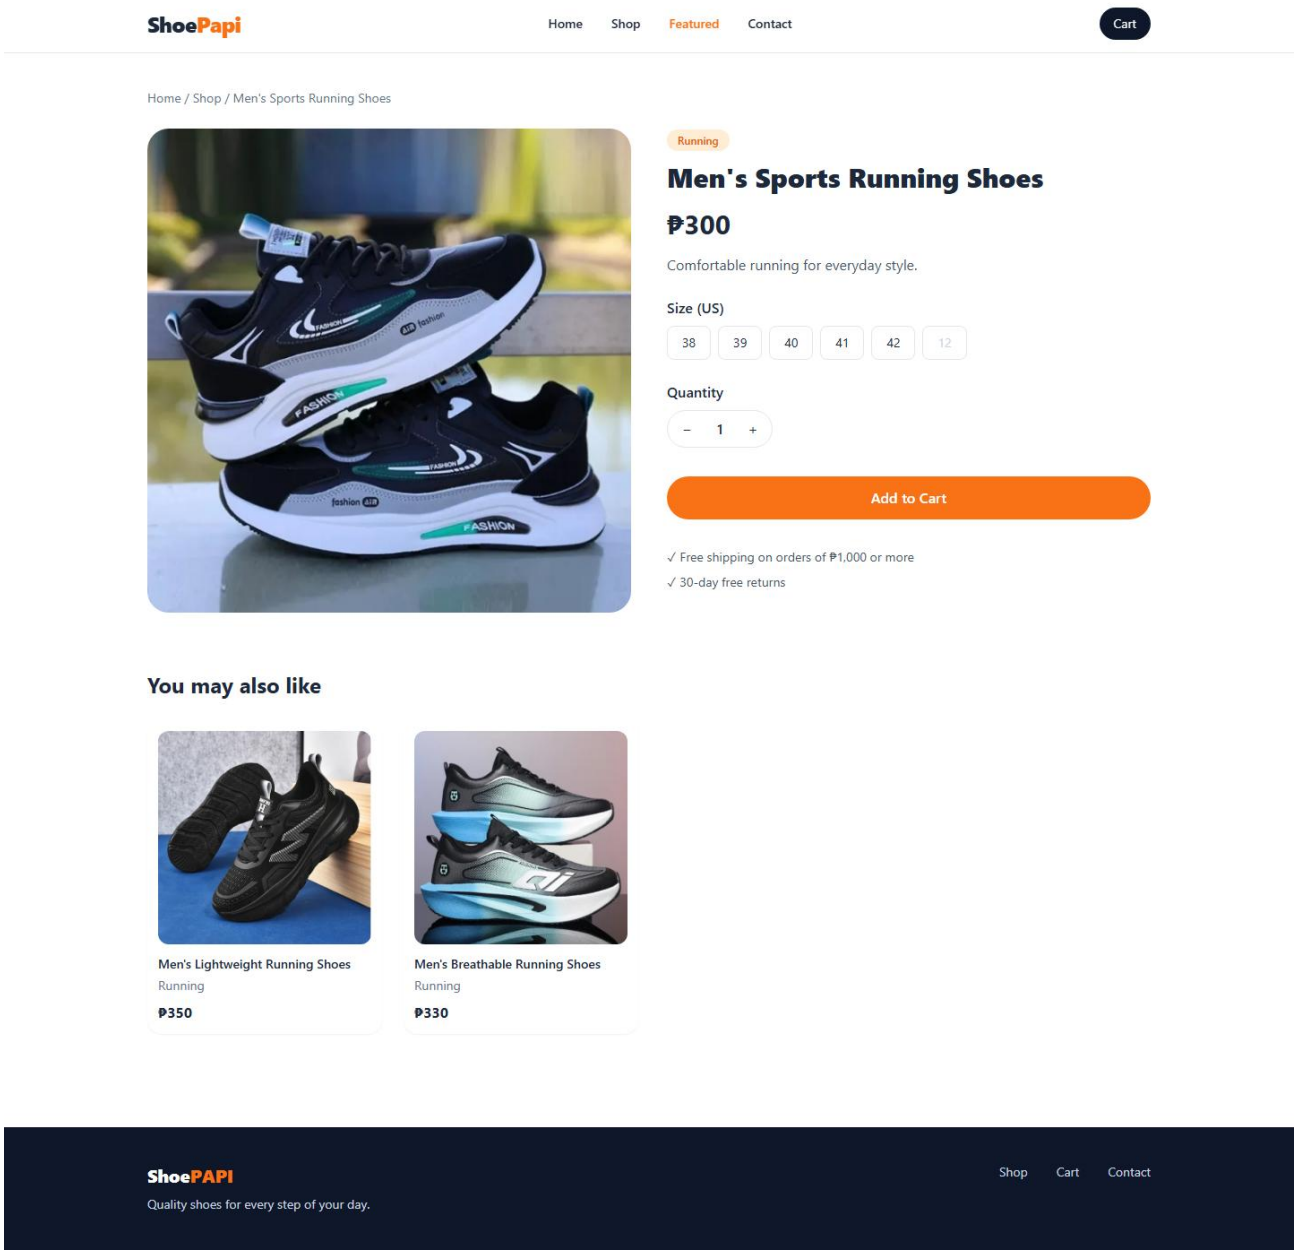

Shop and Product Catalog

The catalog page includes category filters, sort options, shoe photographs, prices, and add-to-cart controls.

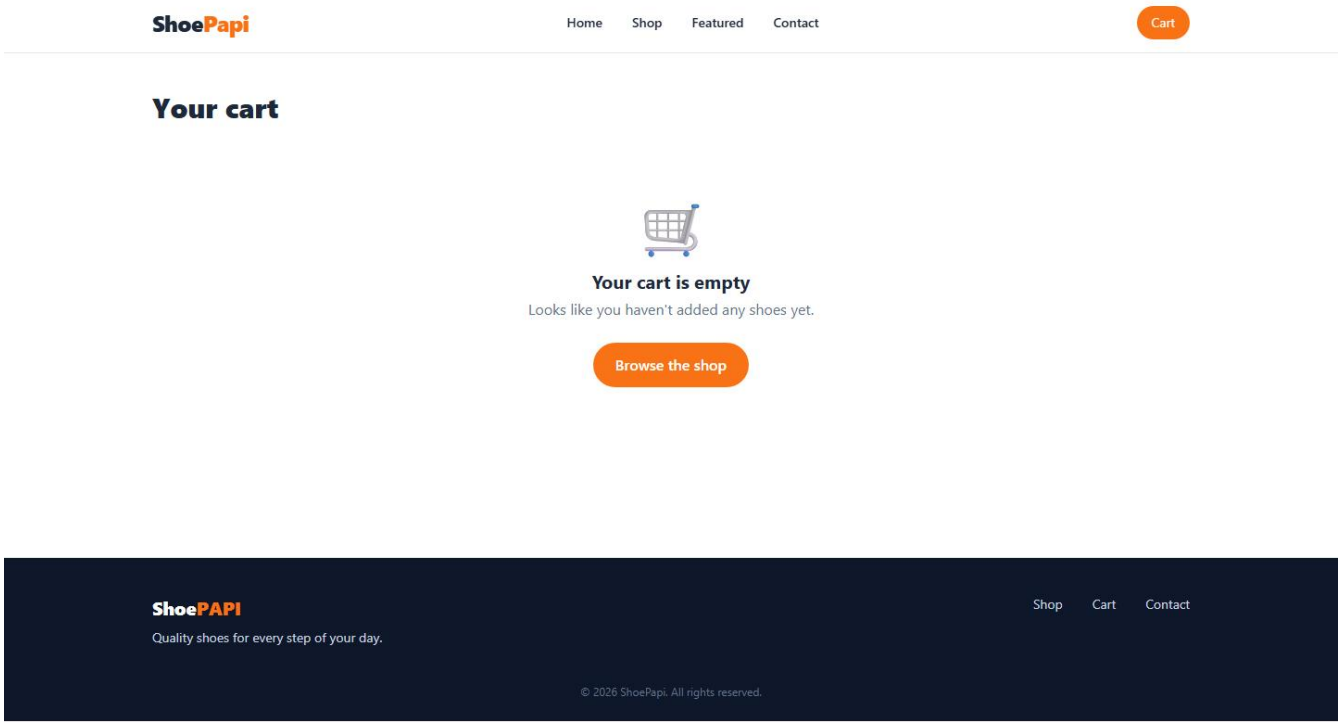

Product Details

The product page presents shoe details, size and quantity controls, related products, and an add-to-cart button.

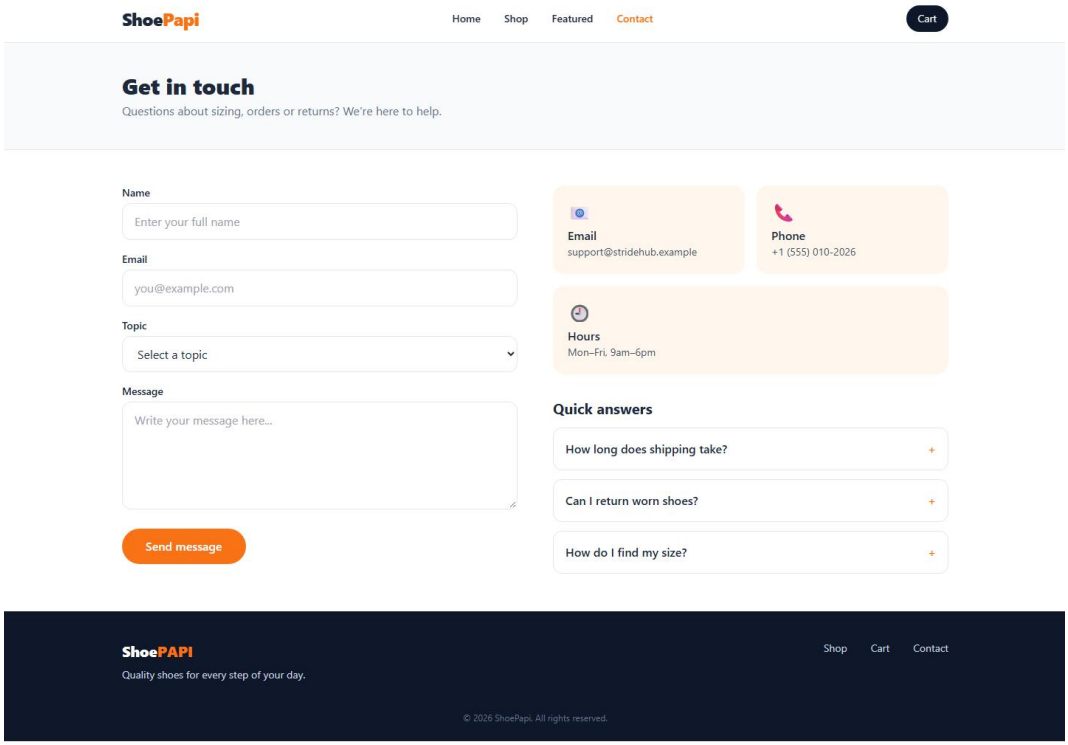

Shopping Cart

The screenshot shows the empty-cart state. With items added, the cart displays quantity controls and an order summary.

Contact Form and Interactive FAQ

The contact page provides form validation and a JavaScript-powered FAQ. Opening an answer closes the previously open answer.

AI-Generated / AI-Assisted Source Code

The development of ShoePAPI utilized a combination of artificial intelligence tools and manual programming. AI tools were used to generate code, provide programming suggestions, and assist in implementing and improving certain website features. The development team also wrote code independently, applied its technical knowledge, and made adjustments to ensure that the website's functionality and design met the project requirements. The percentages below represent the team's estimated distribution of coding contributions based on the development process and

the level of AI involvement. These figures are estimates and are not measurements verified by an automated code analysis tool.

AI-Generated Code: **30%**

AI-Assisted Code: 20%

Manually Coded: **50%**

Total: **100%**
